Memo to File:

RE: Inspection of the Patti Ann
Mine
Atlas Minerals
ACT/037/003
San Juan County, Utah

Tom Tetting and Susan Linner of the Division met on May 25, 1983 with Rick Broschat from Atlas to inspect the above referenced minesite. Stabilization requests made in the January 27, 1983 letter to Richard Blubaugh had been implemented and the purpose of the visit was to view the results.

The entire main storage yard pad has been regraded to a gentle inward slope to prevent continued waste rock erosion on the outslopes. A collection channel has been made through the pad directing runoff toward the west end where a rip-rapped cut will allow it to escape. Scrap and debris have been collected and centralized and a contractor solicited to pick it up. Excellent work has been done even to the point of allowing cat tracks to remain creating small depressions to promote revegetation.

The eastern-most waste rock and low grade ore stockpiles have also been stabilized similarly and a large 3 - 4 foot containment berm placed around the juncture of the perimeter and the road.

An additional period of two years suspension is recommended.
